

METHOD, SYSTEM AND PROGRAM PRODUCTS FOR UPDATING EVENT DATA ON A PAGE USING CODE UNDERSTOOD NATIVELY BY A BROWSER

Abstract of the Disclosure

An event data update capability for a data frame of a browser-displayed page is provided by periodically retrieving event data using a refresh frame of the page and updating the data frame with the event data. The updating of the data frame uses code understood natively by the browser. Periodic retrieval of event data by the refresh frame uses the same network connection used to download the refresh frame from a server.
